

AEGIS AWS First Deploy Checklist

Created: 2026-02-20 Updated: 2026-02-21

This is the fastest path to stand up the first AWS-backed AEGIS environment with ALB + Cognito + ECS.

One-Command Option

After `terraform/aws/terraform.tfvars` is configured, you can run the full flow with:

```
make aws-install-poc REGION=us-east-1 PROJECT_NAME=aegis TAG=latest
```

The detailed steps below are the same sequence, broken out for control and troubleshooting.

1) Verify AWS credentials and tooling

```
aws sts get-caller-identity
terraform version
```

2) Configure Terraform variables

```
cp terraform/aws/terraform.tfvars.example terraform/aws/terraform.tfvars
```

Set at minimum:

- `aws_region`
- `environment`
- `project_name`
- `acm_certificate_arn`
- `cognito_domain_prefix`
- `api_image_tag`
- `admin_image_tag`

Use unique image tags per deployment (for example Git SHA or date tag).

3) Plan/apply AWS infrastructure

```
./scripts/aws_apply_infra.sh --tfvars=terraform/aws/terraform.tfvars --apply
```

Equivalent Make target (plan/apply script wrapper):

```
make aws-apply-infra
```

4) Build and push images to ECR

```
./scripts/aws_build_push_images.sh --region=us-east-1 --project-name=aegis --tag=latest
```

Equivalent Make target:

```
make aws-build-images REGION=us-east-1 PROJECT_NAME=aegis TAG=latest
```

5) Roll new image tags through ECS

Update `api_image_tag` and `admin_image_tag` in `terraform/aws/terraform.tfvars`, then apply again:

```
./scripts/aws_apply_infra.sh --tfvars=terraform/aws/terraform.tfvars --apply
```

6) Create first Cognito admin user

```
USER_POOL_ID=$(terraform -chdir=terraform/aws output -raw cognito_user_pool_id)
aws cognito-idp admin-create-user \
  --user-pool-id "$USER_POOL_ID" \
  --username "<admin-email@example.com>" \
  --user-attributes Name=email,Value=<admin-email@example.com>
Name=email_verified,Value=true
```

7) Verify deployment

```
make aws-verify-deployment REGION=us-east-1 PROJECT_NAME=aegis
ALB_DNS=$(terraform -chdir=terraform/aws output -raw alb_dns)
```

Then:

- open `https://$ALB_DNS/` and confirm Cognito login challenge,
- log in and confirm admin dashboard loads,
- verify API-authenticated flows operate from the dashboard.

8) Post-deploy checks

- Confirm ECS services are stable:

```
aws ecs list-services --cluster "$(terraform -chdir=terraform/aws output -raw ecs_cluster)"
```

- Confirm target group health for API and admin target groups.
- Confirm useful outputs resolve:

```
terraform -chdir=terraform/aws output -raw api_base_url
terraform -chdir=terraform/aws output -raw api_healthz_url
terraform -chdir=terraform/aws output -raw api_target_group_name
terraform -chdir=terraform/aws output -raw admin_target_group_name
```

- Confirm RDS and CloudWatch logs show healthy startup for both ECS services.

9) Run cloud smoke suite (optional gate)

If you have an authenticated admin header context, run:

```
make cloud-smoke-from-terraform \
  PROVIDER=aws \
  TERRAFORM_DIR=terraform/aws \
  ADMIN_HEADER="<Header-Name: value>"
```
